

CLAIM AMENDMENTS

1. (Currently Amended) An analyser comprising:

a substrate of diamond, sapphire or a polymer material;

an array of elongate capillary channels formed in the substrate;

means for driving a sample to be tested along the channels whereby the velocities of components of the sample along the channels depend on the relative molecular weights of those components;

a radiation source and a radiation detector array disposed on ~~either side~~ opposing sides of the channel array so as to simultaneously detect the presence of material in the channels as interruptions in the radiation path between the radiation source and the radiation detector array; and

wherein the radiation detector array comprises an array of obscured regions on the substrate under the channels, and means for detecting an electric current formed by electron-hole pair generation at the obscured regions.

2. (Original) An analyser according to claim 1, in which the substrate is formed of diamond.

3. (Original) An analyser according to claim 1, in which the substrate is formed of sapphire having a coating of nanocrystalline diamond.

4. (Original) An analyser according to any one of claims 1 to 3, in which the channels are less than 250 um deep.

5. (Original) An analyser according to claim 4, in which the channels are less than 150

um deep.

6. (Previously Amended) An analyser according to claim 1, in which the channels are less than 200µm wide.

7. (Previously Amended) An analyser according to claim 1, in which the channels are less than 100 µm wide.

8. (Previously Amended) An analyser according to claim 1, in which the radiation source comprises an ultraviolet light source.

9. (Original) An analyser according to claim 8, in which the ultraviolet light source is operable to generate ultraviolet light at a wavelength of about 260 nm or about 200 nm.

10 -15. (Cancelled).

16. (Currently Amended) An analyser according to claim 15, in which the regions are formed at a lower surface of each channel.

17. (Currently Amended) An analyser according to claim 15, in which the regions are formed at lower surface of the substrate substantially beneath each channel.

18. (New) An analyser comprising:
a substrate of diamond or sapphire material;
an array of elongate capillary channels formed in the substrate;
means for driving a sample to be tested along the channels whereby the velocities of components of the sample along the channels depend on the relative molecular weights of those components;

a radiation source and a radiation detector array disposed on opposing sides of the channel array so as to simultaneously detect the presence of material in the channels as interruptions in the radiation path between the radiation source and the radiation detector array.

19. (New) An analyser according to claim 18, wherein the substrate is formed of diamond.

20. (New) An analyser according to claim 18, wherein the substrate is formed of sapphire having a coating of nanocrystalline diamond.

21. (New) An analyser according to claim 18, wherein the radiation source comprises an ultraviolet light source operable to generate ultraviolet light at a wavelength of about 260 nm or about 200 nm.

22. (New) An analyser according to claim 18, wherein the radiation detector comprises an array of obscured regions on the substrate under the channels, and means for detecting an electric current formed by electron-hole pair generation at the obscured regions.
